Agenda

- **Enabling Cognitive Capabilities: The Knowledge Graph**
- **IBM Cognitive Technologies at Work**
- **The Ecosystem: IBM Bluemix and Rest-API**
- **Use Case: IBM Cognitive Computing for Oncology Care Appropriateness**

- 
- **Enabling Cognitive Capabilities: The Knowledge Graph**

Cognitive Computing

From Unstructured Data
to Cognitively Transparent
Knowledge Representation

From Unstructured Data to Cognitively Transparent Knowledge Representation

Gathering and transforming data into valuable and goal-oriented information is a crucial mission for both **human** and **artificial** decision makers (sensemaking / knowledge management).

In particular, **humans need cognitively transparent information** in order **to make informed decisions**.

In our applied research project we leverage on **IBM advanced content analytics technology** partnered with **knowledge-graph-based approach** to enhance **clinical knowledge sharing** and **medical decisions outcomes**.

How Do Humans & Machine Make Sense of the World

Humans & Machines

SenseMaking & Situational Awareness

- Sensemaking is an active **two-way process of fitting data into a frame (mental framework/ data model) and fitting a frame / ontology around the data.**
- **Neither data nor frame comes first; data evoke frames and frames select and connect data (Knowledge Graphs).** When there is no adequate fit, the data may be reconsidered or an existing frame may be revised.

Human SenseMaking Features

- People **extract cues / attributes** from the context to help them decide on **what information is relevant and what explanations are acceptable** (Salancick & Pfeffer, 1978; Brown, Stacey, & Nandhakumar, 2007)
Extracted cues provide points of reference for linking ideas to broader networks of meaning and are 'simple, familiar structures that are seeds from which people develop a larger sense of what may be occurring." (Weick 1995: 50).

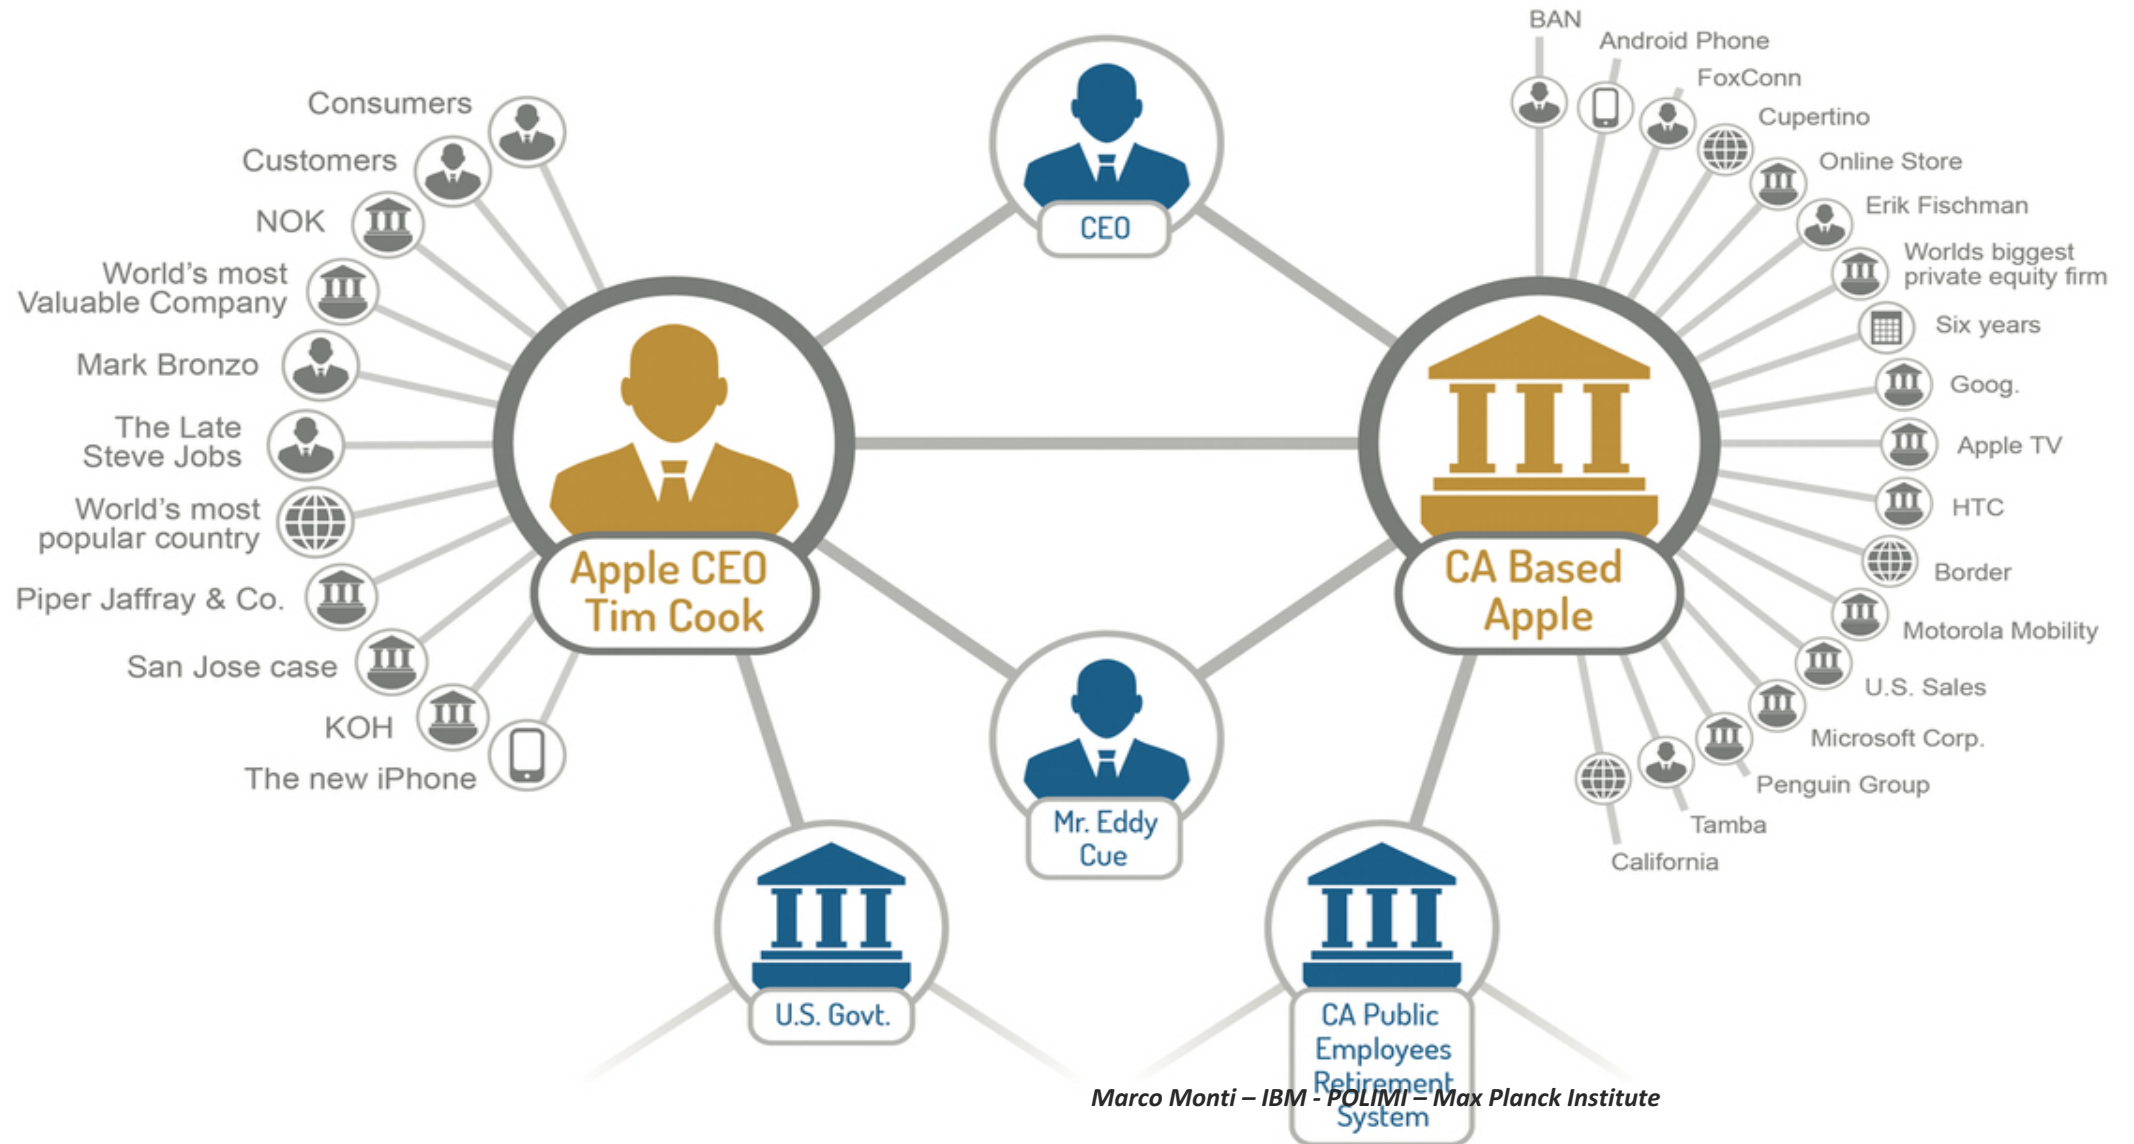

The Creation of New Knowledge

The interaction between Tacit Knowledge & Explicit Knowledge
two modes of knowing vital for the creation of new knowledge.

The Role of Knowledge Graphs in Cognitive Computing

THE KNOWLEDGE GRAPH

LINKS TOGETHER BILLIONS OF ENTITIES, FACTS AND RELATIONSHIPS

What are Knowledge Graphs

- A knowledge graph is composed by a set of **interconnected typed entities and their attributes**. It also contains a simple **ontology**, and represents high quality knowledge, and **provides efficient and effective knowledge service**
- the **distinguished features** of Knowledge Graphs consists in their special **combination of knowledge representation structures, information management processes, and search algorithms**.
- In a knowledge graph, **the basic unit is** (the representation of) a **singular entity**, anything you would like to describe.
- Each entity **might have various attributes**.
- Furthermore, **entities are connected to each other**; This is the so-called interlinking in knowledge graphs (i.e. to bridge separate knowledge graphs).
- Not surprisingly, **each entity needs an identification to distinguish each other**; the entity IDs need to be **globally unique**.

Knowledge Graphs Features

- Knowledge graphs inherit from classic Artificial Intelligence formalisms such as semantic networks and Description Logics.
- **KG** should be regarded to **as high-quality, knowledge intensive information systems**. Firstly, the knowledge they convey should be **consistent**.
- Besides consistency, “high quality knowledge” should also feature a certain degree of **completeness, accuracy, and timeliness**.
- To help achieving such quality standards, Knowledge Graphs are typically **implemented in a centralized way**.
- **KG** should be able to **provide a set of knowledge services**, which should be adequate enough for implementing tasks or **achieving goals**. This involves features like high **reliability** (e.g., fast response time, and high fault tolerance) and high **usability** (e.g., good learnability, and the ease of use).

What is Watson Explorer?

IBM Watson Explorer combines **search and content analytics with unique cognitive computing capabilities** to help users find and understand the contextual information they need to work more efficiently and make better, confident decisions at the point of impact.

Watson Explorer enables organizations to

- **Explore:** Securely connect to, search and explore all of your organization's data, regardless of format or where it is stored or managed
- **Analyze:** Gain insights from unstructured dark data with advanced content analytics using hypothesis-free discovery
- **Interpret:** Scale expertise with leading-edge cognitive services from Watson Developer Cloud

Explore

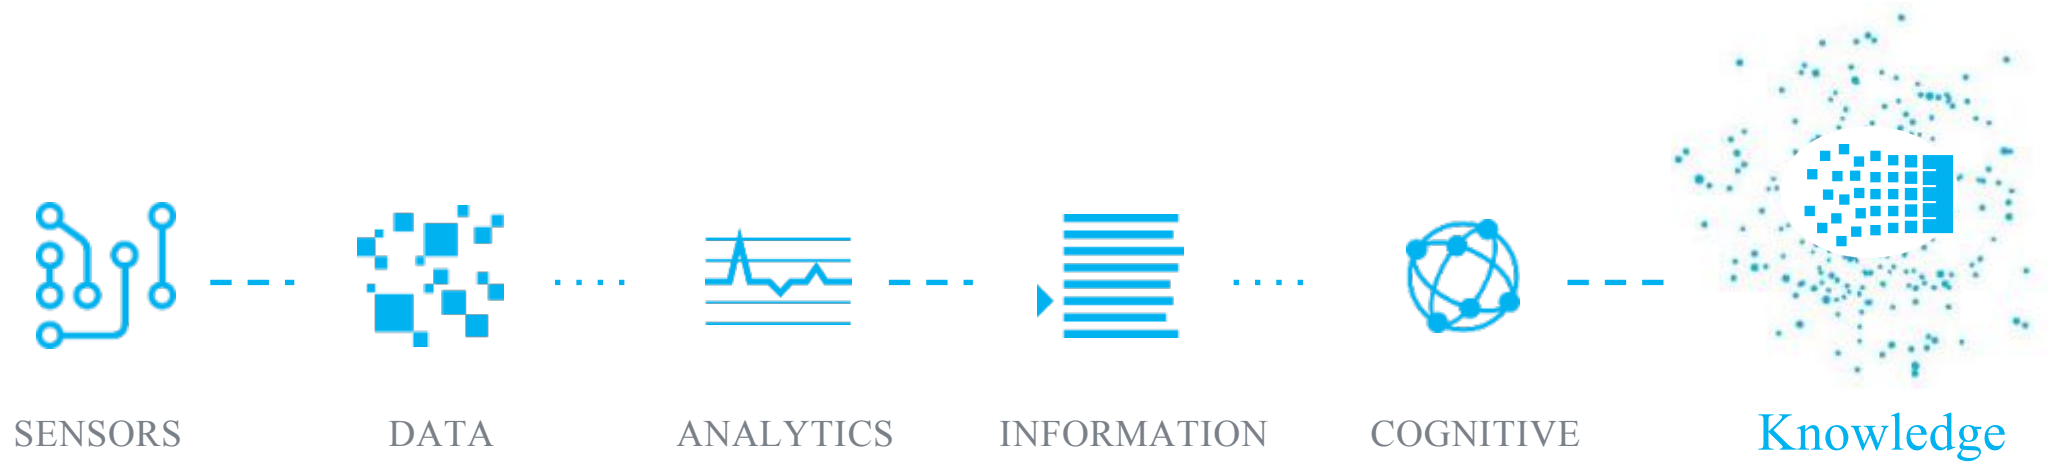

Analyze

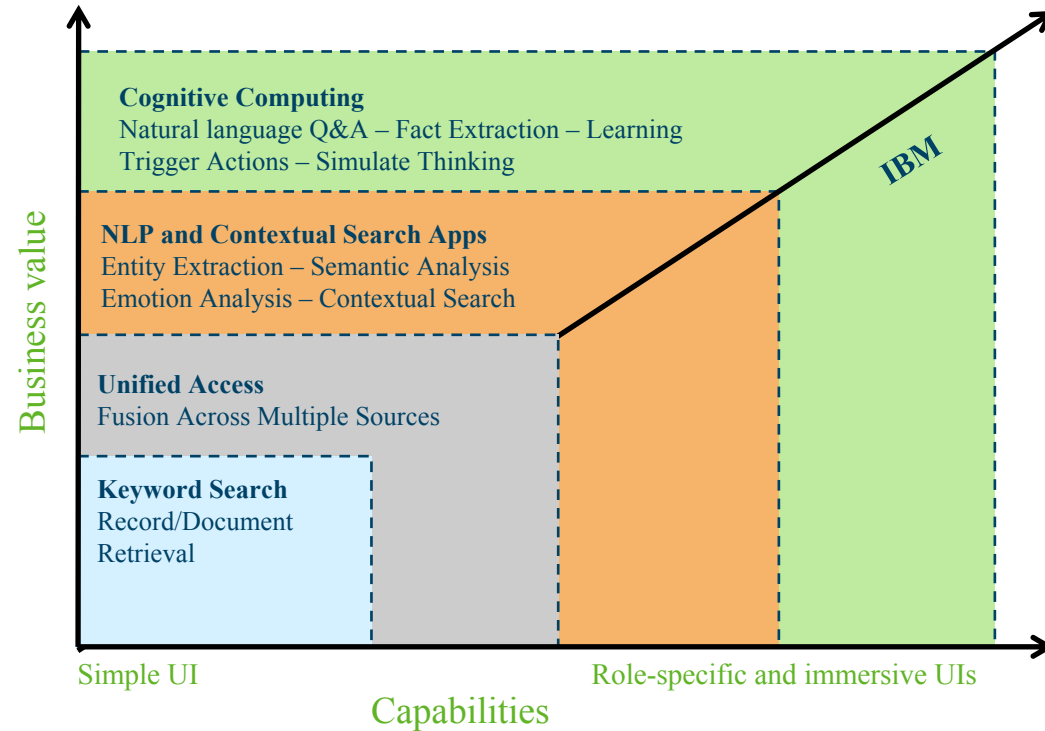

Interpret

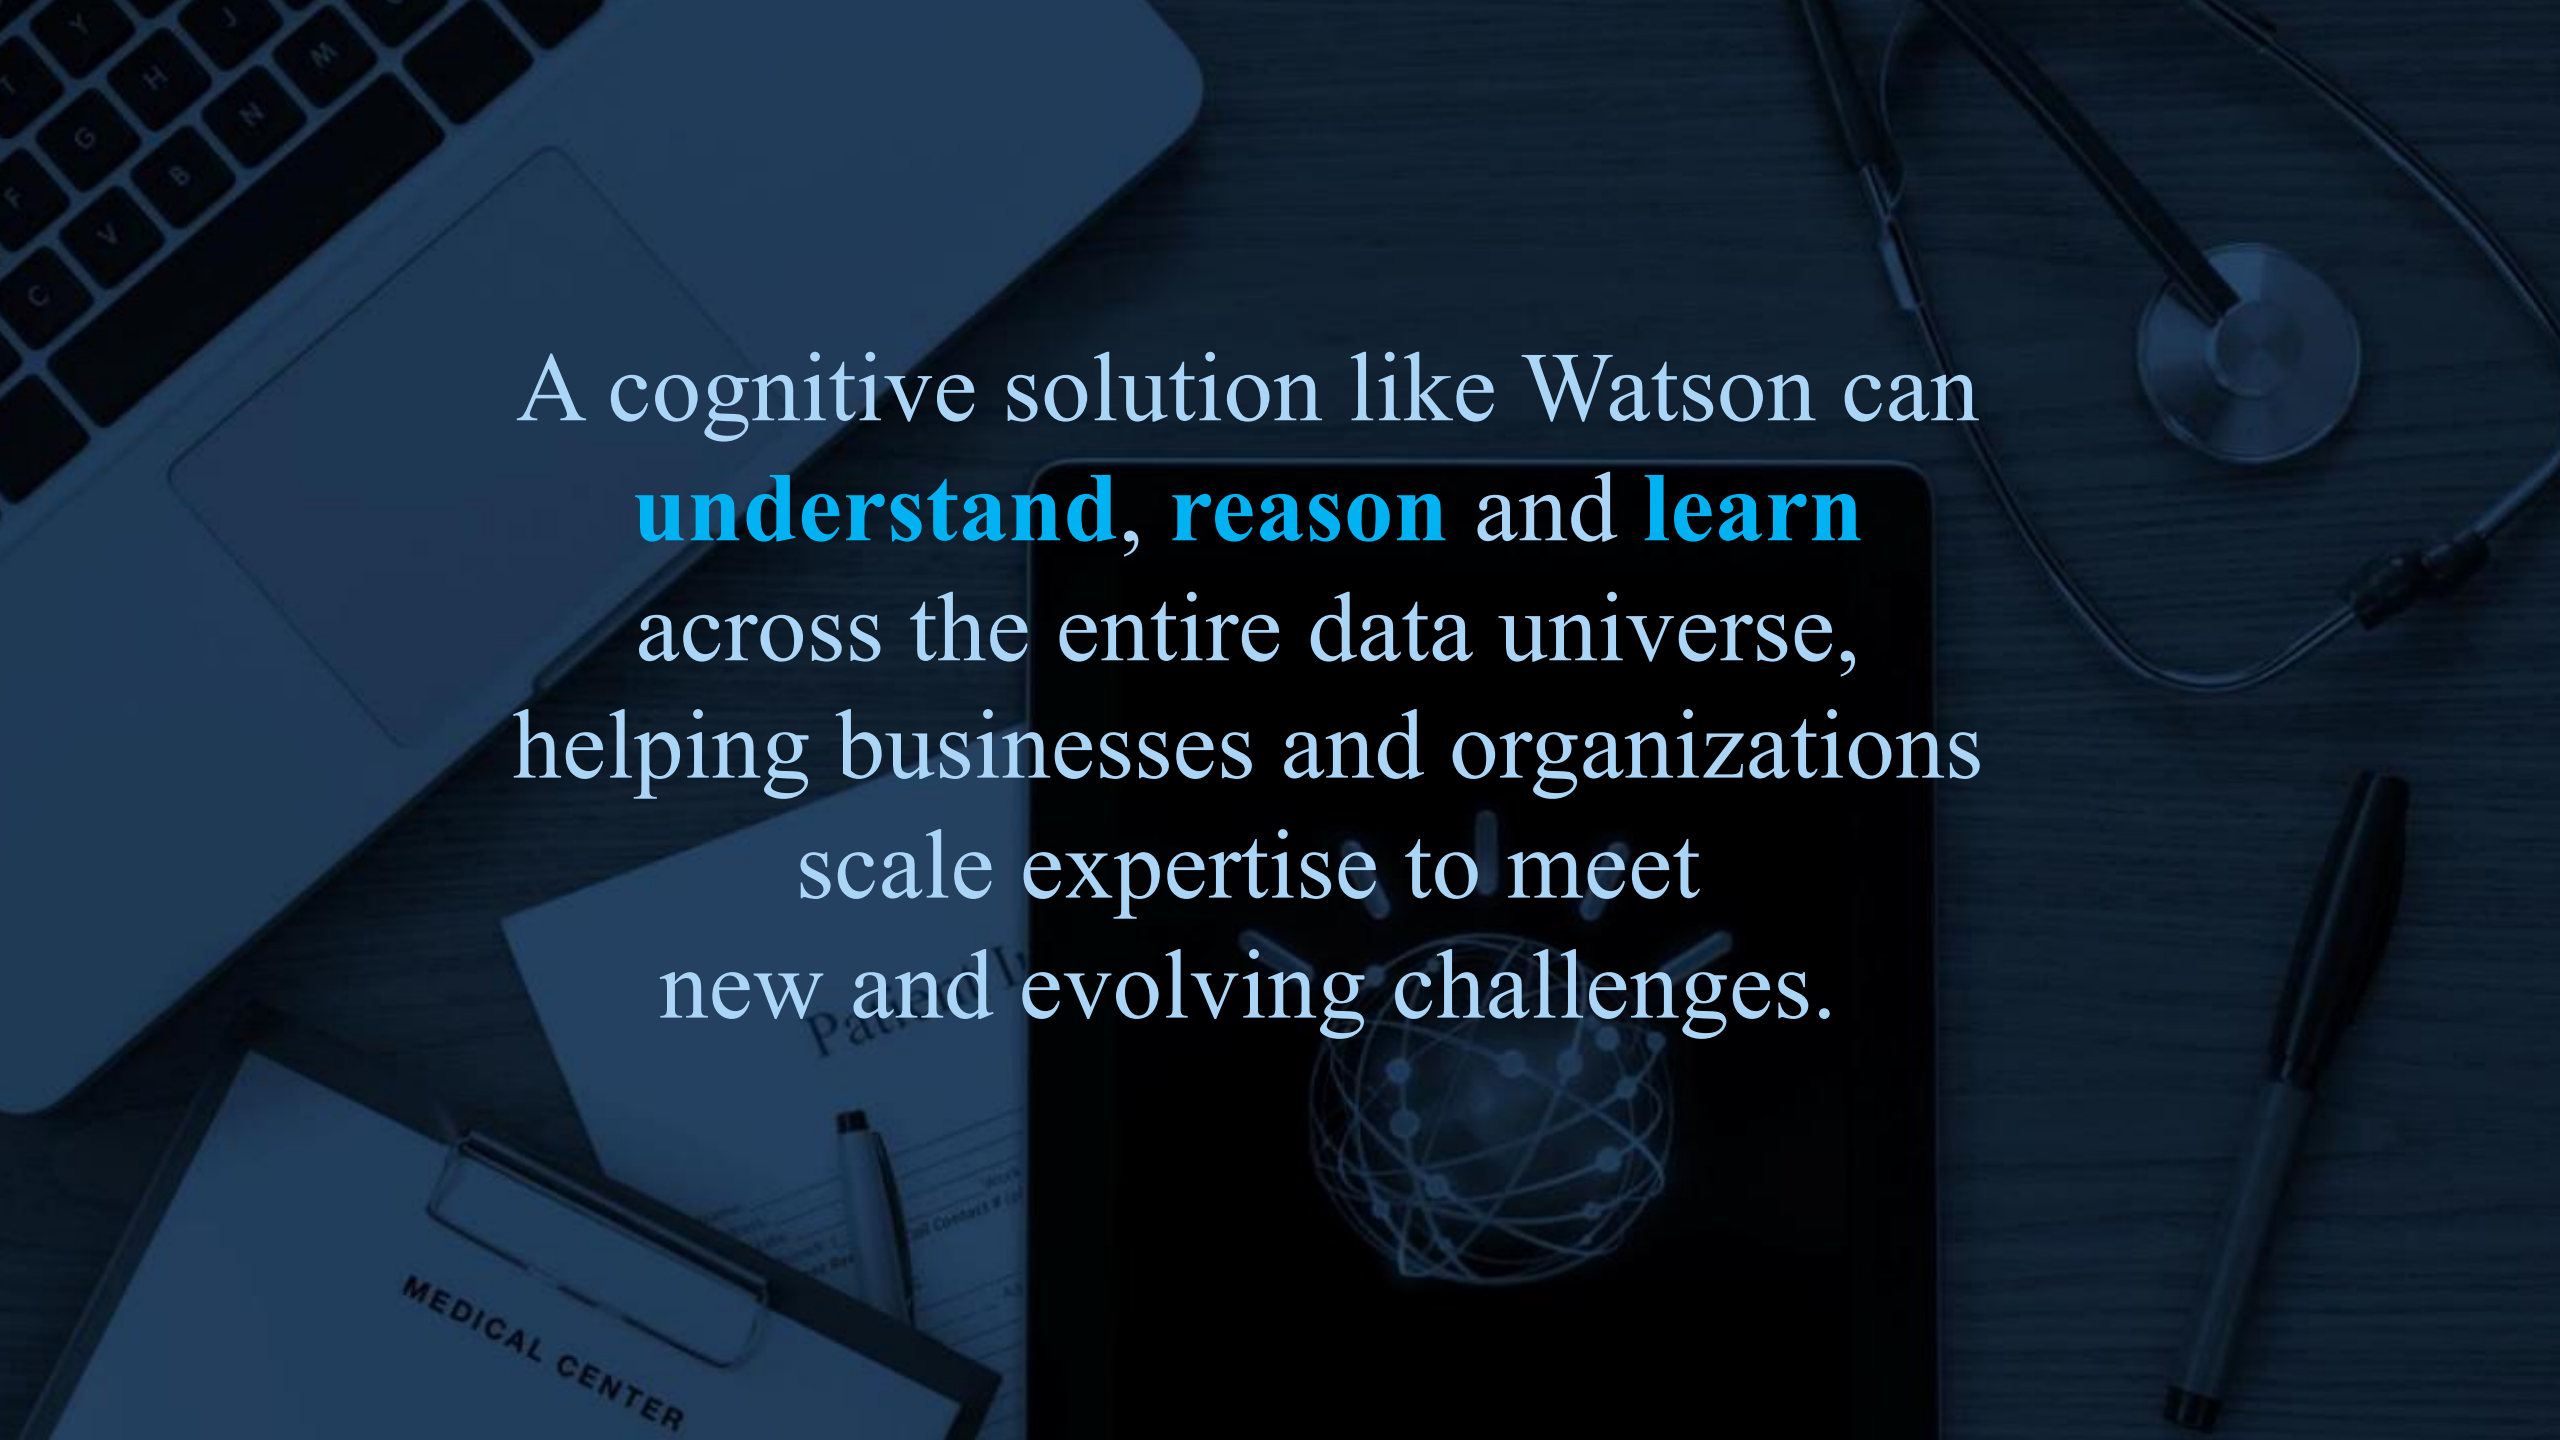

Cognitive systems democratize innovation by scaling knowledge

Evolution from search through cognitive computing

There is a natural and cumulative evolution from basic search, through advanced NLP, to cognitive computing ... all with the goal of delivering information and scaling expertise.

The background is a dark blue, monochromatic image of a medical professional's workspace. It features a laptop in the upper left, a stethoscope in the upper right, and a clipboard with medical forms in the lower left. The forms include fields for 'Patient Name', 'Address', and 'Phone Number', and a section labeled 'MEDICAL CENTER'. A glowing, wireframe globe is centered at the bottom of the text area.

A cognitive solution like Watson can
understand, reason and **learn**
across the entire data universe,
helping businesses and organizations
scale expertise to meet
new and evolving challenges.

Bring Watson's APIs cognitive technology to Watson Explorer

Watson's APIs are cognitive building blocks that can harness data in Watson Explorer

Watson Developer Cloud

Enhance, scale, and accelerate human expertise through **user modeling, relationship extraction, and more**

New packaging with same functionality

Healthcare Annotators – deliver value out of the box

Problems

- Result of a series of interim annotations that identify diseases, symptoms, and disorders
- Normalize to standard terms and standard coding systems including SNOMED CT, ICD-9, HCC, CCS
- Capture timeframes of the problem
 - determine if past or current problem
- Determine confidence (Positive, Negative, Rule Out)

Procedures

- Identify compound procedures
- Normalize to standard terms and standard coding systems including SNOMED CT, CCS, CPT
- Capture timeframes of the procedure

Medications

- Series of interim annotations that identify drugs, administrations, measurements
- Normalize to standard terms RxNorm

Cancer Diagnosis

- Attributes: Name, Date, Modality, Grade (Scale, Value), Behavior, Site, Measurement

Allergies

- Drug allergies, generic allergies e.g. food

Export Adapter

- Configure annotation output destination
- Default configuration is IBM Healthcare Provider Data Model staging tables

Demographic and Social

- Patient Age
- Living Arrangement
- Employment status
- Smoking status
- Alcohol use

Compliance & Noncompliance

- Patient's history of medication compliance with directions such as "take all doses, even if you feel better earlier"
- Noncompliance - Patient's history of medication noncompliance with directions.

Labs results

Type of lab test performed, unit of measure, result value

Ejection Fraction – in support of CHF use cases

Coding Systems – can identify these codes

- CPT
- CCS
- HCC
- NDC (National Drug Codes)

100+ dictionaries, 800+ parsing rules

IBM Cognitive Computing for Oncology Care Appropriateness

Who's who

Marco Monti – IBM - POLIMI – Max Planck Institute

Founded in 1925, the **Fondazione IRCCS Istituto Nazionale dei Tumori (INT)** is a top-tier Scientific Research and Treatment Institution which has achieved renowned excellence in the field of **pre-clinical and clinical oncology research and care**.

In 2011 the Istituto performed:

- **13,630 in-patient admissions (415 beds)**
- 8,464 one-day-hospitalization admissions (67 beds)
- **1.1 million out-patient treatments**
- 11,500 surgical operations

The **IBM Research Lab in Haifa (HRL)** has conducted decades of research that have been vital to IBM's success. R&D projects are being executed today in areas such as **healthcare and life sciences**, discovery, verification technologies, multimedia, active management, information retrieval, programming environments, business transformation, and optimization technologies. The Lab houses IBM's biggest research center outside the US, and employs over 500 people.

The research project

Marco Monti – IBM - POLIMI – Max Planck Institute

Business needs:

- Huge amount of clinical data reported in **free-text** annotations to leverage on;
- Clinical Decision-Making based on real **evidence (clinical trials)**;
- Strong need for **automatic tools** to monitor clinical appropriateness.

The project aims to provide **clinical doctors and healthcare managers** with a comprehensive **view of the care delivery processes** and their **appropriateness**, highlighting their clinical **outcome** and their overall **cost** for the organization.

Unit engaged in INT:

- Oncologia Medica Tumori Mesenchimali dell'Adulto, dott. Paolo Casali
- Oncologia Medica dei Tumori della Testa e del Collo, dott.ssa Lisa Licitra

Medical Treatment Programs:

- **Recommended**
- **Performed**

What is the «Treatment Program **Deviation** Analysis»?

Treatment Programs (TP) Deviation Analysis

Identifies differences between **recommended** and **performed** treatments as documented in the clinical data by care givers.

Documented Treatment Programs that have been analyzed can:

1. **adhere** to one of the recommended TPs (guidelines)
2. **do not adhere** to any recommended TPs (guidelines)

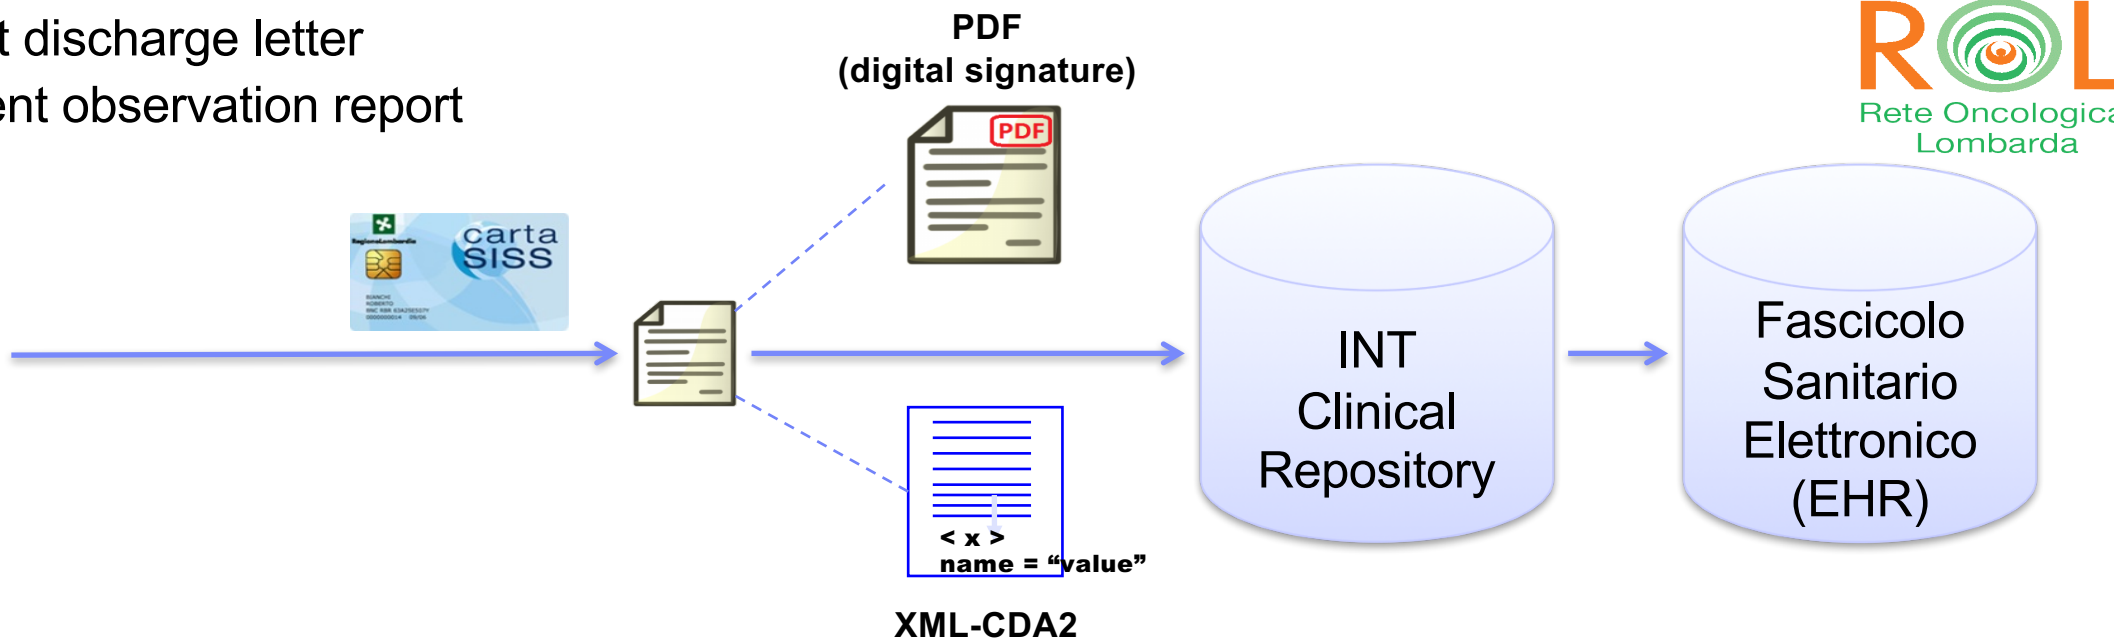

Clinical Tests

**Clinical Best Practices
based on
Literature Review
and
Medical Consultations**

**ROL Guidelines
Patients'
Discharge Letters**

- In-patient discharge letter
- Out-patient observation report

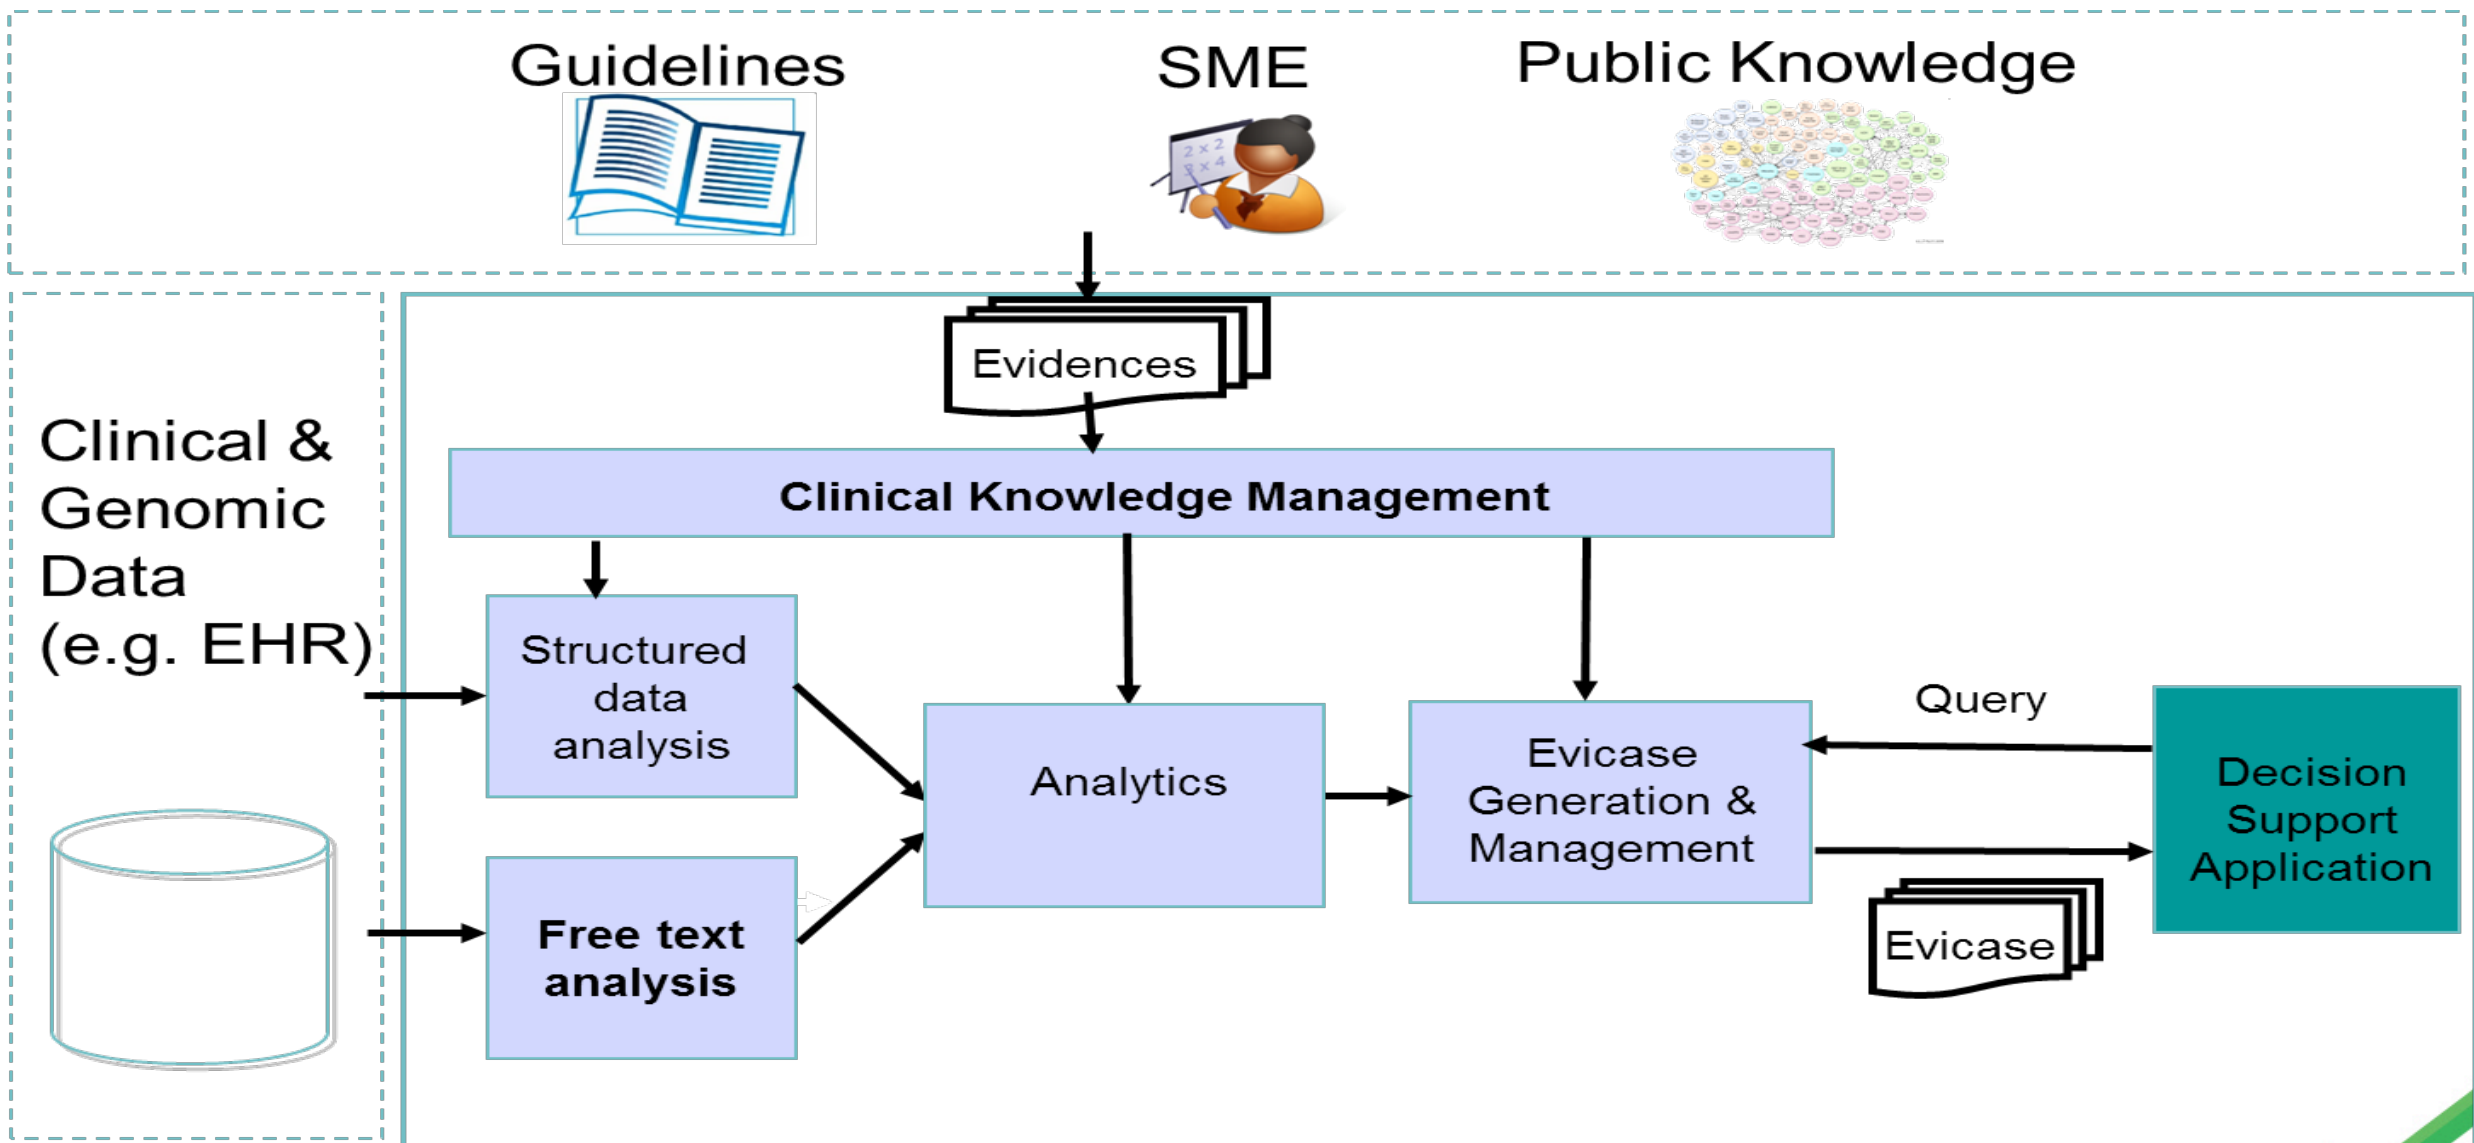

**ROL
clinical
guidelines**

*Sharing
classifications
and semantics*

- **Clinical Presentations**
- Oncological clinical history
- Extra-oncological clinical history
- **Recommended Treatment Programs**
- Performed Treatments
- Patient's clinical status

Content Analytics Applied to Report on AVE8062 Use

Il paziente è stato ricoverato per valutazione di malattia e programmazione terapeutica. È stata dunque effettuata una TC del torace e dell'addome, con riscontro di incremento dimensionale del noto espanso nel contesto del muscolo gluteo sinistro (attualmente di circa 8 cm verso i precedenti 5,5 cm); appare invece immodificata la localizzazione ipodensa in regione lombare nel contesto del tessuto sottocutaneo di circa 30 mm. Il distretto toracico appare tuttora libero da malattia. In considerazione dello stato, dell'estensione metastatica di malattia e dei pregressi trattamenti effettuati, è stata proposta al paziente la partecipazione ad uno studio clinico randomizzato in doppio cieco, che prevede l'impiego di Cisplatino in associazione a placebo verso AVE8062, farmaco dotato di attività antivascolare. Il paziente ha accettato il programma proposto e firmato il relativo consenso informato. Si è somministrato pertanto il primo ciclo chemioterapico con Cisplatino ed AVE/placebo, soggettivamente ben tollerato. Nel corso del ricovero sono stati eseguiti inoltre prelievi seriatati di farmacogenomica e farmacocinetica. Si dimette pertanto il paziente, in buone condizioni generali, con indicazione a proseguire il trattamento in regime ambulatoriale.

oncology care guidelines

IBM Oncology
Care Guide

use to guide
care decisions

IBM Oncology
Care View

use to view
past care decisions

- Leverages the **IBM Advanced Content Analytics** (ICA) to perform free text analytics on patient's data
- Utilizes similar natural language processing (NLP) methods used in **IBM Watson**
- Has built-in **medical terminology** support (taxonomies / ontologies)
- By exploiting ICA text analytic capabilities, we succeeded in processing **free-text** information **together** with **structured data**

Achievements:

- Collaboration among clinical and technical project people
- **Sharing a common semantic platform and domain view**
- Tools and insights for improvements: technical refinements and training to clinicians

Future perspectives:

- Extension to other oncology care organization and other pathologies (i.e. Rete Oncologica Lombarda, Rete Nazionale Tumori Rari)
- Extension to include biomolecular data
- Cost evaluation linked to performed treatments
- Comparison among oncology care organizations (outcome, case-mix, costs)

IBM Vision on Personalized Medicine

Marco Monti – IBM - POLIMI – Max Planck Institute

Customer: Fondazione IRCCS - Istituto Nazionale dei Tumori di Milano

Data: Patient's discharge summaries, clinical guidelines and survival data from the Lombardy region

Technology: Free text analytics, data mining, advanced analytics and visualization

Value: Gap analysis between clinical guidelines and provided treatments, decision support, care management, cost efficiency

Won the Polytechnic University ITC Award on Clinical Governance and Decision Support

AlchemyLanguage

AlchemyLanguage is a collection of APIs that offer text analysis through natural language processing. The AlchemyLanguage APIs can analyze text and help you to understand its sentiment, keywords, entities, high-level concepts and more.

- AlchemyLanguage offers several API functions as part of its text analysis service, each of which uses **sophisticated natural language processing techniques to analyze your content.**

•AlchemyLanguage:Intended Use

IBM Watson now powers a Hilton hotel robot concierge

IBM/Hilton

Just arrived to your hotel, desperate for some munch at a decent restaurant nearby, and not really into speaking with human beings? Connie the robo-concierge is here to help. American hotel multinational Hilton has teamed up with tech giant IBM to trial a robotic concierge powered by IBM's AI software Watson.

The bot has been christened "Connie" after the chain's founder, Conrad Hilton, and it is currently assisting residents at Hilton McLean hotel, in Virginia. From its station next to the reception desks, Connie helps guests navigate around the hotel and find restaurants or tourist attractions in the area—but it is not able to check them in just yet.

Connie's physical support is Nao, a French-made 58cm-tall android that has become the go-to platform for educational and customer care tasks, thanks to its relative affordability (about £ 6,000 or \$9,000). But the concierge's brain is based on IBM's flagship AI program Watson—the Jeopardy!-winning system engineered to understand people's questions and answer them in the best way possible.

In this case, Watson's main role is natural language processing, which enables the bot to welcome guests, grasp their spoken queries, and answer accordingly. The information on local attractions and interesting sites is actually channelled from the database of travel platform WayBlazer, also an IBM's partner. Connie is also designed to improve itself through interactions with human customers, learning from frequent queries how to fine-tune its recommendations.

Concept Expansion

Link euphemisms or colloquial terms to more commonly understood phrases.

Concept Expansion is a Watson service that analyzes large amounts of text to create a dictionary of contextually related words.

Concept Expansion's pattern recognition technology **helps users identify contextually similar terms and phrases**, create dictionaries, and find or organize text based on those dictionaries. It knows that **'The Big Apple'** refers to **New York City** and that **'getting in touch'** means **communicating by email, letter, or phone**.

Concept Expansion: Demo

This demo uses unstructured content extracted from thousands of random websites. Providing some starting seed terms will return new concepts or words, ranked in order of contextual similarity to your input.

Initial Seeds

Give the service a starting point. One concept per line. Each concept can have up to 3 words each.

Try:

Slang

Movies

Cities

Apple
banana
peach

Analyze

Output

Add the best results to your seeds. Then, run the demo again and watch your dictionary get bigger and better.

Results

JSON

raspberry	+
blueberry	+
melon	+
mango	+
strawberry	+
apricot	+
pineapple	+

Concept Insights

Rather than limiting findings to traditional text matching, **Concept Insights explores information based on the concepts behind your input.**

Concept Insights **maps input text to a concept graph that is based on the English language Wikipedia.** The service not only identifies explicit links when a concept is directly mentioned, but it **also provides implicit links to concepts that are not directly mentioned.**

Concept Insights: Demo

Try the service

This service uses a pre-existing graph of concepts (based on Wikipedia) to surface the concepts in your input. It will use these concepts to recommend relevant content from the corpus you ingest. For this demo, discover [TED talks](#) using topics, words, or concepts. Or, paste in some text and we'll identify the concepts for you.

Input

 [Reset](#)

Concepts **Body of Text**

[Example 1](#) [Example 2](#)

answer accordingly. The information on local attractions and interesting sites is actually [channeled](#) from the database of travel platform [WayBlazer](#), also an IBM's partner. Connie is also designed to improve itself through interactions with human customers, learning from frequent queries how to fine-tune its recommendations.

Top 3 Abstracted Concepts:

Watson (computer)

Hilton Worldwide

Hotel

[View JSON](#)

The service is using the [annotate_text](#) API to help you abstract concepts. For an in-depth explanation, visit the [Documentation](#).

Concept Insights: Demo

Output

TED talks may have explicit concept matches from your input. However, they also have implicit matches, with a single related concept or a collection of concepts. You may be surprised at what you would miss using a traditional keyword search.

Your concepts

Watson (computer)

Hilton Worldwide

Hotel

Hotel

Office

Restaurant

"...I mean now we're hoping we start to see it; they've already built City Hall, attracted two **hotels**. I could imagine beautiful housing going up along there without tearing down another tree. So..."

Dialog

Script conversations any way you like to answer questions, walk through processes, or just to chat!

The IBM Watson Dialog service enables a developer to automate branching conversations between a user and your application. The Dialog service enables your applications **to use natural language to automatically respond to user questions**, cross-sell and up-sell, walk users through processes or applications, or even hand-hold users through difficult tasks. The Dialog service **can track and store user profile information to learn more about end users**, guide them through processes based on their unique situation, or pass their information to a back-end system to help them take action and get the help they need.

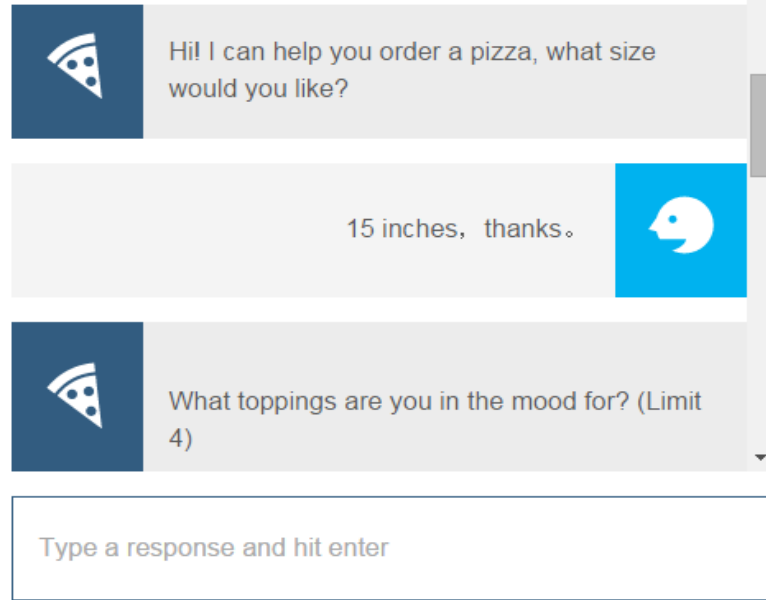

Dialog:Demo

Choose a Dialog Template

A template that contains prepared structures to create natural dialog

Order A Pizza Template

Try the service

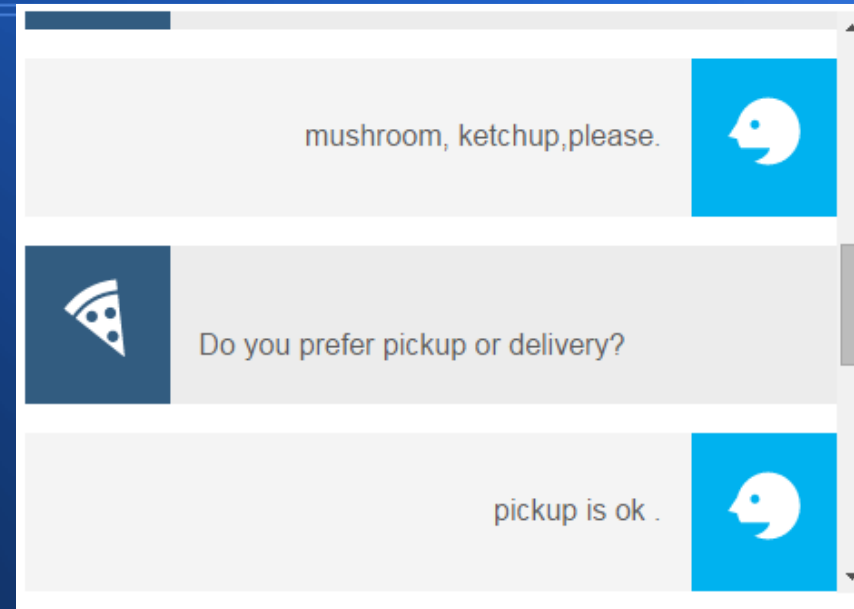

Hi! I can help you order a pizza, what size would you like?

15 inches, thanks.

What toppings are you in the mood for? (Limit 4)

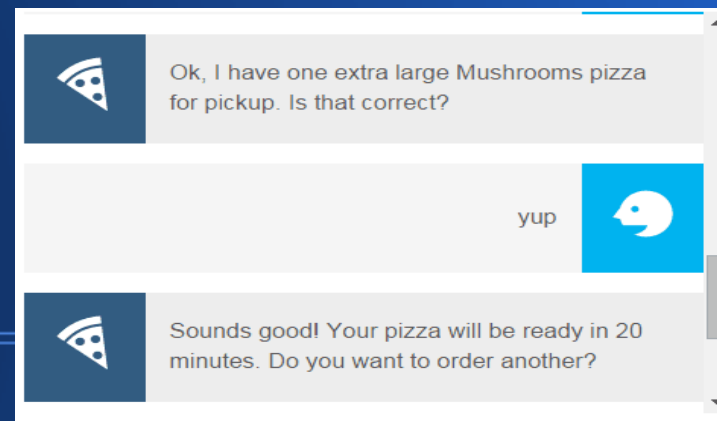

Type a response and hit enter

mushroom, ketchup, please.

Do you prefer pickup or delivery?

pickup is ok .

Ok, I have one extra large Mushrooms pizza for pickup. Is that correct?

yup

Sounds good! Your pizza will be ready in 20 minutes. Do you want to order another?

Document Conversion

Converts PDF, Word, or HTML documents into HTML, Plain Text, or JSON Answer Units needed by other Watson services

Service provides an Application Programming Interface (API) that enables developers **to transform a document into a new format**. The input is a single PDF, Word, or HTML document and the output is an HTML document, a Text document, or Answer units that can be used with other Watson services.

Language Translation

Translate and publish content in multiple languages.

The Watson Language Translation service provides domain-specific translation utilizing Statistical Machine Translation techniques that have been perfected in our research labs over the past few decades. Currently, three domains are available that provide translation among a total of seven languages. For best results, a domain that matches the content to be translated should be chosen.

Language Translation: Demo

Translate Text

Text Rest API

system engineered to understand people's questions and answer them in the best way possible.

In this case, Watson's main role is natural language processing, which enables the bot to welcome guests, grasp their spoken queries, and answer accordingly. The information on local attractions and interesting sites is actually channelled from the database of travel platform [WayBlazer](#), also an IBM's partner. Connie is also designed to improve itself through interactions with human customers, learning from frequent queries how to fine-tune its recommendations.

Text JSON

Abstract

The invention claims a method and system for changing the content of the electronic document and a method for establishing the relation information changing history database method and system. Wherein the method comprises the following steps: browsing the electronic document in response to a client request, analyzing the request to obtain related information based on the related information, it is determined that the electronic document between at least parts of the named entity relationship information exists is changed, and if the

Natural Language Classifier

Interpret and classify natural language with confidence.

The service enables developers without a background in machine learning or statistical algorithms to create natural language interfaces for their applications. **The service interprets the intent behind text and returns a corresponding classification with associated confidence levels.** The return value can then be used to trigger a corresponding action, such as redirecting the request or answering a question.

Natural Language Classifier: Demo

Ask a question about the weather

Watch the Natural Language Classifier categorize your weather-related question. In this demo, the classifier is trained to determine whether the question is related to *temperature* or *weather* conditions. The output includes the top classification and a confidence score.

Ask

Sample questions

Is it hot outside?
What is the expected high for today?
Will it be foggy tomorrow morning?
Should I prepare for sleet?
Will there be a storm today?

The classifier often scores well with terms that it hasn't been trained on. In the sample questions, the words "sleet," "foggy," and "typhoon" are not part of the [training data](#), yet the classifier correctly handles questions about them.

Output

Natural Language Classifier is **99%** confident that the question submitted is talking about '**conditions**'.

Classification: **conditions**

Confidence: **99%**

Personality Insights

Uncover a deeper understanding of people's personality characteristics, needs, and values to drive personalization.

Personality Insights extracts and analyzes a spectrum of personality attributes to help discover actionable insights about people and entities, and in turn guides end users to highly personalized interactions. The service outputs personality characteristics that are divided into three dimensions: the Big 5, Values, and Needs. While some services are contextually specific depending on the domain model and content, Personality Insights only requires a minimum of 3500+ words of any text.

Personality Insights: Demo

Personality Portrait

4011 words analyzed: **Strong Analysis**

Summary

You are inner-directed, skeptical and strict.

You are adventurous: you are eager to experience new things. You are imaginative: you have a wild imagination. And you are solemn: you are generally serious and do not joke much.

You are motivated to seek out experiences that provide a strong feeling of sophistication.

You consider achieving success to guide a large part of what you do: you seek out opportunities to improve yourself and demonstrate that you are a capable person. You are relatively unconcerned with helping others: you think people can handle their own business without interference.

Personality Insights: Demo

Relationship Extraction

Extracts relationships between different text entities.

Unlike general-purpose text analytics tools, **Relationship Extraction leverages Watson machine learning technologies. The API can analyze news articles and use statistical modeling to perform linguistic analysis of the input text.** It then finds spans of text and clusters them together to form entities, before finally extracting the relationships between them.

Relationship Extraction: Demo

Try the service

For example, if you are a news agent researching a person, you can input his or her blogs, emails, tweets, etc into the text window below and see all the places and events that he or she talked about (a location is represented by the label GPE, which stands for Geo Political Entities)

restaurants or tourist attractions in the area—but it is not able to check them in just yet.

Connie's physical support is Nao, a French-made 58cm-tall android that has become the go-to platform for educational and customer care tasks, thanks to its relative affordability (about £6,000 or \$9,000). But the concierge's brain is based on IBM's flagship AI program Watson—the Jeopardy!-winning system engineered to understand people's questions and answer them in the best way possible.

In this case, Watson's main role is natural language processing, which enables the bot to welcome guests, grasp their spoken

Retrieve and Rank

Enhance information retrieval with machine learning.

helps users **find the most relevant information for their query by using a combination of search and machine learning algorithms to detect “signals” in the data**. Built on top of Apache Solr, developers load their data into the service, train a machine learning model based on known relevant results, then leverage this model to provide improved results to their end users based on their question or query.

Tone Analyzer

Discover, understand, and revise the language tones in text.

Tone Analyzer might be able to help. The service uses linguistic analysis to **detect and interpret emotional, social, and writing cues found in text.**

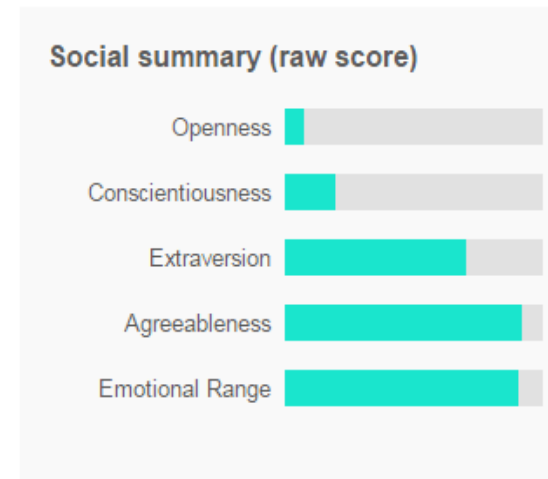

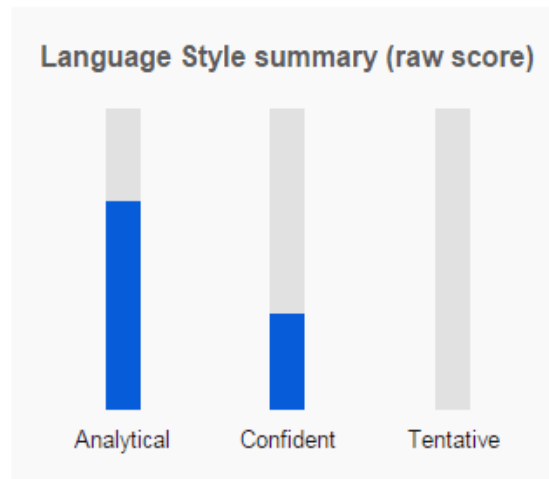

Tone Analyzer: Demo

Output

The tone API analyzes text at the document level and the sentence level for [3 categories of tones](#): Emotion, Language, and Social. It produces 2 levels of scores, at the document-level, and the sentence-level.

Document-level

Quickly assess the ways your text is or is not making the right impression. Learn how to interpret these graphs for your use case in the [Documentation](#).

Tone Analyzer: Demo

Sentence-level

Discover the sentences with the strongest emotion, language, and social cues in the context of your text. Hover over any sentence to view raw scores for all tones in a category, or rank all sentences according to a single tone.

Openness		0.50	Customer: Someone created an account using my email account.
Conscientiousness		0.50	Customer: You can't spell

Speech to Text

- **The Speech to Text service converts the human voice into the written word.**
- Watson Speech to Text can be used anywhere there is a need to bridge the gap between the spoken word and its written form. This easy-to-use service uses machine intelligence to combine information about grammar and language structure with knowledge of the composition of an audio signal to generate an accurate transcription. It uses IBM's speech recognition capabilities to convert speech in multiple languages into text. The transcription of incoming audio is continuously sent back to the client with minimal delay, and it is corrected as more speech is heard. Additionally, the service now includes the ability to detect one or more keywords in the audio stream. The service is accessed via a WebSocket connection or REST API.

Speech to Text: Demo

Transcribe Audio

You may choose to spot your keywords by entering them (separated by commas) in the text box. Use your microphone (compatible only with [Google Chrome](#) and [Mozilla Firefox](#)). Upload pre-recorded audio (WAV for uncompressed audio, FLAC or OPUS) file formats. Drag and drop recorded audio onto the page, or use the audio samples provided. The returned result includes the recognized text, word alternatives (aka confusion networks), and spotted keywords.

Text to Speech

- Designed for streaming low-latency synthesis of audio from written text. **The service synthesizes natural-sounding speech from input text in a variety of languages and voices that speak with appropriate cadence and intonation.**
- Watson Text to Speech provides a REST API to synthesize speech audio from an input of plain text. Multiple voices, both male and female, are available across Brazilian Portuguese, English, French, German, Italian, Japanese, and Spanish. Once synthesized in real-time, the audio is streamed back to the client with minimal delay. The Text to Speech service now enables developers to control the pronunciation of specific words.

Text to Speech: Demo

Input Text

The text language must match the selected voice language: Mixing language (English text with a Spanish male voice) does not produce valid results. The synthesized audio is streamed to the client as it is being produced, using the HTTP chunked encoding. The audio is returned in the Ogg Opus format which can be played using [VLC](#) and Audacity players.

Visual Insights

- **Visual Insights enhances the customer view** by analyzing online photos and video to extract consumer insights related to interests, activities, hobbies, life events, and products
- With so many social media channels used by a brand it's important to know not only your customers, but also your competitors to ensure alignment across channels. Visual Insights works to give users **tools to ensure consistency across those social media channels**, segment customers to an individual level, create targeted campaigns, and align their social media output to followers' preferences by running comparative analysis with competitors' feeds.

Visual Recognition

- **Understand the contents of images. Trainable for custom content.**
- Visual Recognition allows users to understand the contents of an image or video frame, answering the question: “What is in this image?” **Submit an image, and the service returns scores for relevant classifiers representing things such as objects, events and settings.** What types of images are relevant to your business? How could you benefit from understanding and organizing those images based on their contents? With Visual Recognition, users can automatically identify subjects and objects contained within the image and organize and classify these images into logical categories. Need to train Visual Recognition on specific or custom content? Easily train a new classifier by sending examples and voila! Custom image recognition!

Tradeoff Analytics

- **Helps users make better choices to best meet multiple conflicting goals.**
- **Tradeoff Analytics is a Watson service that helps people make decisions when balancing multiple objectives.** The service uses a mathematical filtering technique called “Pareto Optimization,” that enables users to explore tradeoffs when considering multiple criteria for a single decision. When your company makes decisions, how many factors need to be considered? What’s the process like? How do you know when you’ve found the best option? With Tradeoff Analytics, users can avoid lists of endless options and identify the right option by considering multiple objectives.
